

Style

Style is a business software solution for companies trading style-colour-size products. The demands of meeting modern logistics expectations are complex. Producers and wholesalers who source and sell both locally and abroad need to offer individualised customer service to their customers. Style provides such a management tool.

Style is an Enterprise Resource Planning system. It facilitates the creation and processing of sales orders, purchase orders and stock control. These transactions are supported by a variety of master data records (e.g. customers, suppliers, styles, seasons, etc) that allow individual configuration of processes.

Added to its base system, Style includes a number of higher level processes such as price calculations, finished and raw goods requirements planning, sales / purchases / invoice analysis and critical path management.

Style is configurable. Multiple companies, warehouses, languages, currencies and documentation formats are possible. Many of the default processing rules can easily be amended to suit changing business situations.

Style is based on 25 years+ of experience in system design. The software is based on proven *Java* technology and utilises a number of leading third party software components that add to its performance and intuitive feel.

- ✓ *Information as you need it*
- ✓ *Improve your customer service*
- ✓ *Intuitive look and feel*
- ✓ *Available on the cloud*
- ✓ *Regular updates*
- ✓ *Full Support*

Style

Highlights

Customer Service Orientation

Style's sales order process is designed for both speed of input and real-time information thereby providing improved customer service.

Individualised Sales Orders

All customers operate differently and therefore have different needs. Style allows individual sales orders to be tracked until delivered to the customer.

Critical Path / Management by Exception

Style has background processes that identify discrepancies allowing staff to immediately resolve exceptions.

Specific Instruction Management

Managing customer, supplier and organisational specific needs is complex. In the event of staff changes, Style will disseminate relevant instructions to those who need to know.

Purchasing Order Planning

Style contains a powerful purchase order planning module that combines delivery dates, stock on hand and open purchase orders, providing real time stock status and automated purchase order creation.

Pricing Control

Simple to detailed pricing strategies are possible. Price lists can be created for different currencies and individual customers.

Reporting and Analysis

Reports are configurable and real-time, ensuring users have a 'finger on the pulse'. Included in report results is a 'drill down' link to base transactions.

Cost Savings

Style is a fully integrated, configurable application. Master records drive how the system processes transactions, with information provided where and when required. This allows staff to concentrate on productive tasks.

Reputation

Style's pedigree is German with over 25 years of experience in a demanding environment. This software works! Full support and training is given during implementation. Ongoing support includes regular software updates.

Style

Functionality

Transactions

Style's transactions include sales orders, purchase orders and stock records. These transactions are the life blood of a business, and as such are well protected by Style's design. All transactions are saved in real-time to the database with full roll-back security and logging.

Processing

Processing is the heart of Style. Transactions and master data are combined to provide timely information to users of Style and their business partners.

Multi-company

Style allows for an unlimited number of companies to be setup in the system, each being configured separately. Customers, suppliers and sales agents can be shared between companies.

Master Data

Master Data is the configuration of how Style processes transactions. Individual views of master data are available together with a mass maintenance process (particularly useful for seasonal setups).

Documentation

Style documentation output is in PDF format. Templates can be customised to individual businesses. PDF's can be viewed, printed and / or emailed.

Features

Client

Style is based on Windows look and feel. It is very easy to use and its intuitive menu and screen layout structure makes it quick to learn.

- ✓ Windows look and feel
- ✓ Simple to advance search options on all records
- ✓ All tables export to excel
- ✓ Java client (runs on Windows, Linux, Mac)
- ✓ Role based security
- ✓ Email for PDF documentation (e.g. Sales Orders, Purchase Orders, Delivery Notes, etc.)

System

The Style system is designed on modern 3 tier client server architecture. It is both robust and flexible.

- ✓ Multiple companies
- ✓ Separate company configurations
- ✓ Multiple languages
- ✓ Unlimited size tables
- ✓ Available on the cloud
